Project Name: Quick Tomato's 🍅
Project Manager: India D.
Developer: Brandon W.
Researcher: Dionisiy C.
Documentation: Lenesse M.
Designer: Priscilla U.

Application Description: POS (point of sale system) between servers and kitchen to better facilitate the restaurant, in terms of management, service and revenue.

Key Features: inventory management, menu management, employee management (employee name, as in who placed the order), waiter side – status fields, payment indicator (paid/pending), revenue tracker (possible cost/expense later)

Tech: database, website, php, cns, sql
LucidChart: https://www.lucidchart.com/pages/

Restaurant POS between kitchen & wait staff
- ACID transactions: ACID is an acronym that refers to the set of 4 key properties that define a transaction: Atomicity, Consistency, Isolation, and Durability.
- Lock items during transactions to prevent negatives
- Narrow down tech we want to use
- Narrow down features
